or rejects proposed
changes”

“approval by an external body simply doesn’t work to increase the stability of production systems”

“However, it certainly slows things down.”

Implementing Technology Change

Multi-firm reviews | **Published:** 05/02/2021 | **Last updated:** 05/02/2021

Print this publication

This review sets out the findings from our cross-Financial Services change management review which looked at how financial firms manage technology change, the impact of change failures and the practices utilised within the industry to help reduce the impact of incidents resulting from change management.

Why we conducted this review

A number of significant IT failures in the last 10 years have led to greater scrutiny of the effectiveness of technology change management in the financial services (FS) sector. The evolution of business models, economic and regulatory change and the increasing pace of technological advancements have emphasised the need for firms to change with confidence. Technology is integral to the delivery of FS and while technology change presents firms with the opportunity to innovate, lower costs and improve the quality of service, it also introduces operational risks.

CABs
approved
93% of
major
changes

**“This raises questions
over the effectiveness
of CABs as an assurance
mechanism”**

What's my point?

**Effective teams are
autonomous - which
requires loose coupling**

CAB groups don't have the context

Catch issues through good observability

CABs were just one example

Making the case for governance

Salesloft Drift breach, August 2025

Informational Message

INFORMATIONAL MESSAGE DETAILS

ID# 20000217 | ONGOING

Security Advisory: Unusual Activity in a Third Party Connected App

We want to inform our customers about a recent security incident involving the Drift app, published by Salesloft, that was installed by individual customers. Salesforce security teams detected unusual activity that may have resulted in unauthorized access to a small number of customers' orgs data via the app's connection to Salesforce.

It is important to note that this issue did not stem from a vulnerability within the core Salesforce platform, but rather from a compromise of the app's connection.

Upon detecting the activity, Salesloft, in collaboration with Salesforce, invalidated active Access and Refresh Tokens, and removed Drift from AppExchange. We then notified affected customers.

We're continuing to work with Salesloft as part of our investigation and provide updates as appropriate, including notifying and supporting affected customers with remediation. If you need support, please reach out through Salesforce Help: <https://help.salesforce.com/s>.

Mandiant Incident Response

Investigate, contain, and
remediate security
incidents.

[Learn more](#)

Recommendations

Given GTIG's observations of data exfiltration associated with the campaign, organizations using Salesloft Drift to integrate with third-party platforms (including but not limited to Salesforce) should consider their data compromised and are urged to take immediate remediation steps.

Impacted organizations should search for sensitive information and secrets contained within the integrated platforms and take appropriate action, such as revoking API keys, rotating credentials, and performing further investigation to determine if the secrets were abused by the threat actor.

Responding to this breach

Lots of AI FOMO

An incident involving many teams

Do you understand what data you have where?

Governance at Drift

Mandiant's investigation has determined the threat actor took the following actions:

- In March through June 2026, the threat actor accessed the Salesloft GitHub account. With this access, the threat actor was able to download content from multiple repositories, add a guest user and establish workflows.
- The threat actor then accessed Drift's AWS environment and obtained OAuth tokens for Drift customers' technology integrations.

Furthermore, we are implementing new multi-factor authentication processes and further refining limitations to the application environment. These measures are complemented by an ongoing analysis of available logs and configuration settings, as well as the remediation of secrets within the environment and GitHub hardening activities.

Supply chain attack on npm

npm debug and chalk packages compromised

[Charlie Eriksen](#) | #Malware

 Published on: September 8, 2025

 Last updated on: September 15, 2025

Starting at September 8th, 13:16 UTC, our Aikido intel feed alerted us to a series packages being pushed to npm, which appeared to contains malicious code. These were 18 very popular packages,

- `backslash` (0.26m downloads per week)
- `chalk-template` (3.9m downloads per week)
- `supports-hyperlinks` (19.2m downloads per week)
- `has-ansi` (12.1m downloads per week)

sarahwells.dev

ALERT

Widespread Supply Chain Compromise Impacting npm Ecosystem

Release Date: September 23, 2025

CISA is releasing this Alert to provide guidance in response to a widespread software supply chain compromise involving the world's largest JavaScript registry, npmjs.com. A self-replicating worm—publicly known as “Shai-Hulud”—has compromised over 500 packages.^[i]

After gaining initial access, the malicious cyber actor deployed malware that scanned the environment for sensitive credentials. The cyber actor then targeted GitHub Personal Access Tokens (PATs) and application programming interface (API) keys for cloud services, including Amazon Web Services (AWS), Google Cloud Platform (GCP), and Microsoft Azure.^[ii]

<https://www.cisa.gov/news-events/alerts/2025/09/23/widespread-supply-chain-compromise-impacting-npm-ecosystem>

sarahwells.dev

Responding to this breach

Does our code depend on any of the packages?

<https://xkcd.com/2347/>

sarahwells.dev

- Conduct a dependency review of all software leveraging the npm package ecosystem.
 - Check for `package-lock.json` or `yarn.lock` files to identify affected packages, including those nested in dependency trees.

<https://www.cisa.gov/news-events/alerts/2025/09/23/widespread-supply-chain-compromise-impacting-npm-ecosystem>

Modern software estates are complicated

Getting governance right

Foundations

Alignment

Choices

Guardrails

Foundations: Know your software estate

Building your inventory

Why do I want an internal developer portal, anyway?

Here's what you actually want: your developers waking up, drinking a cup of coffee, then getting into a flow and spending their day building new features or solving hard business problems.

And here's what you really don't want: your developers waking up, drinking a cup of coffee, then chasing your other developers in order to figure out who owns the service that just broke this other service, only to discover it was maintained by someone who doesn't work here anymore, but wait, someone finally found documentation for it, except never mind, the docs have never been updated, and oh yeah, the whole thing was written in Ruby even though everyone else has been using Node except for that one dude who won't give up on Perl. Aaargh.

Welcome to Biz Ops, Sarah

Cataloguing and connecting FT product & tech since 2018

Search

Our goal

To provide a single place to store information about how our people and technology relate to the various aspects of our business.

By representing this complex web of information as a graph, and providing tools to interact with it, we hope to make it easier to answer questions about our estate, and to identify and remediate problems.

- ✓ An idea of where needs attention
- ✓ Basis for response - and for automation

Aligning technology decisions

Know the direction of travel

Technology Strategy 2025-2027

1. Cloud-Only Infrastructure

We will migrate entirely to cloud architecture, decommission our data centers, and implement automated CI/CD pipelines to reduce costs by 40% and achieve 99.9% uptime.

2. Unified Data Platform

We will build a modern data lake with real-time analytics and self-service BI tools to accelerate decision-making and enable AI-driven personalization.

3. Digital Customer Experience

We will redesign customer touchpoints with mobile-first, API-driven architecture and AI personalization to improve satisfaction and increase digital engagement.

4. Zero-Trust Security

We will implement comprehensive cybersecurity with zero-trust architecture, AI threat detection, and automated compliance to protect against evolving threats.

5. AI Integration & Innovation

We will establish AI labs to develop machine learning capabilities, automate business processes, and integrate AI across products to create competitive advantages and new revenue streams.

Building on the strategy

sarahwells.dev

Communication and knowledge sharing

Summary

Issue

We need to store secrets, such as passwords, private keys, authentication tokens, etc.

Some of the secrets are user-oriented. For example, our developer wants to be able to use their mobile phone to look up a password to a service.

Some of the secrets are system-oriented. For example, our continuous delivery pipeline needs to be able to look up the credentials for our cloud hosting.

Decision

Bitwarden for user-oriented secrets

Vault by HashiCorp for system-oriented secrets.

Status

Decided. We are open to new alternatives as they arise.

Details

Assumptions

For this purpose, and our current state, we value user-oriented convenience, such as usable mobile apps.

- We want to ensure fast easy access on the go, such as for a developer doing on-call system reliability engineering.

What you get:

- ✓ People can make decisions
- ✓ Less duplication of effort
- ✓ Fewer surprises

Making smart technology choices

The allure of shiny and new

The case for boring technology

Dan McKinley

<https://mcfunley.com/choose-boring-technology>

sarahwells.dev

When to break the boring rule

Developing a culture of thoughtful adoption

Innovation to support business outcomes

The impact on governance itself

What you get:

- ✓ Innovation in the right places
- ✓ Standardisation for everything else
- ✓ Plans, not chaos

Building guardrails that work

Guardrails vs policies vs standards

✓ Policy

A high-level statement of intent or principle, usually approved by leadership.

Purpose: Explains what must be done and why

Characteristics:

- Broad, overarching, and strategic
- Often technology-agnostic
- Non-negotiable: everyone must follow it

Example:

“All production systems must be backed up daily and backups must be retained for at least 30 days.”

Standard

A set of specific, detailed rules or requirements that operationalize the policy.

Purpose: Explains how the policy is met, often with technical details.

Characteristics:

- More specific and measurable
- Often define technical configurations, frequency, or thresholds
- Can vary by environment or system

Example (to support the backup policy):

“All production databases must use vendor-supported snapshot backups scheduled at midnight UTC, with retention set to 35 days.”

Guardrail

A control that guides behaviour to keep it in line with policies or standards.

Purpose: Keeps teams aligned to policies without needing constant manual review.

Characteristics:

- Often built into tools
- Can be preventive (blocking unsafe changes) or detective (alerting on drift)
- Balance: tight enough to protect, loose enough to allow innovation

Example:

“A spending alert that triggers when monthly spend exceeds 80% of the forecasted budget.”

In summary:

	What	Example
Policy	High-level rule	"All data must be encrypted at rest."
Standard	Detailed, actionable requirement	"Use AES-256 encryption for all databases."
Guardrail	Check or control	"Prevent deployment of storage without encryption enabled."

Make the right thing the easy thing

1. Buy vs Build

Can you buy something to solve this problem rather than building it?

2. Procurement

We need to go through a procurement process for any new relationship with a supplier, whether free or paid

3. TGG Endorsement

Changes to the way the FT uses technology should be raised at the Tech Governance Group

4. Adding to Biz Ops

Make sure the initial record has been created

5. Security & Privacy

We need to build secure products and services

6. Accessibility & Browser Support

We need to build websites that meet the needs of our customers

7. Analytics, Logs & Metrics

We need to make sure we know how the things we built are used

8. Change & Release Logging

All changes made at the FT must be logged

9. Healthchecks & Monitoring

Make sure people can tell whether your system is up and working as expected

10. Runbooks

Could someone else fix a problem with your service

11. Service Tier & Support

Is this brand or business critical or could we wait til the morning to fix it?

12. Performance

How would you know if performance started to tank?

13. Cost Management

Are you paying over the odds for this?

14. Going Live

How to take your system live

15. While the Service is Live

Maintaining your service

16. Decommissioning

How to turn your service off

The FT's Engineering Checklist

sarahwells.dev

4. Adding to Biz Ops

Make sure the initial record has
been created

You needed
to do this to
spin up **AWS**
resources

4. Adding to Biz Ops

Make sure the initial record has
been created

Build in flexibility for legitimate exceptions

10. Runbooks

Could someone else fix a problem
with your service
